Zen Carriere Multimedia Homework2 Roadmap

Requirements:

We have to create a request for the data in our database file using AJAX. We must then put the content from the dataset on the page

During the data fetch we must ensure our code handles for errors at each stage of an AJAX request.

Plan:

Make a fetch request for the dataset json file. Parse the json and turn it into a usable dataset. Handle the data by creating a function for it. In the function clone a template that gets filled out with the information in the dataset. Lastly have a little error handling to output an error message to the console. Also (and I'm sure there's a better way but this worked) have another data file with an error message to output if the data fails.
